function [nextPoint] = restrictedClockWise(prevPoint, vertices, cutFraction)
% the restricted choas algorithm, where a vertex that is clockwise one
% vertex away can not be chosen.

%Input: prevPoint - 2 by 1 vector of real numbers that shows the (x,y)
%                   coordinates of the previously chosen point.
%       vertices - number of vertices by 2 array, where each row is the coordinates
%                  of a specific vertex.
%                  For example, a square will be 4 by 2
%       cutFraction - a real number that is the calculated cutting fraction
%                  for a specific polygon.
%                  For example, a square would be 0.5.
%Return: nextPoint - 2 by 1 vector of the next point

% Creating the persistant variable assigned to randomVertex
persistent a

% getting a random number
